### Project Description

This project is the construction of a new and private wharf and boat ramp 20km west of central Port Moresby. The new 180m berth will help ease traffic at Port Moresby's main port.

Kramer Ausenco was appointed to do thorough checks on the sheet pile wall and backfill, the potential risk of liquefaction during seismic event, the finished surface level of the wharf and the concrete capping beam and surface treatment. There are regular inspections by our structural engineers who will, upon project completion, issue a structural adequacy certificate.

### Project Role

- Structural Engineering
